

## Listing of Claims

This listing of claims 1-3 will replace all prior versions, and listing of claims in the application.

1. (Currently Amended) A method for detecting malicious scripts using a static analysis,

comprising the step of:

    checking whether a series of methods constructing a malicious code pattern exist and whether parameters and return values associated between the methods match each other,

    wherein the checking step comprises the steps of:

        classifying, by modeling a malicious behavior ~~in such a manner that it includes a~~ to include combination of unit behaviors each of which is composed of sub-unit behaviors or one or more method calls,

converting each identified unit behavior and method call sentence into a matching rule for defining sentence types to be detected in script codes and

generating at least one a relation rule for defining a relation between rule variables used in the sentences satisfying the matching rule;

identifying generating instances of the matching rule by searching for code patterns matched with the matching rule from a relevant script code to be detected, extracting parameters of functions used in the searched code patterns and storing the extracted parameters in the rule variables; and

identifying generating instances of the relation rule by searching for instances satisfying the relations rule from a set of the generated instances of the matching rule.

2. (Original) The method according to claim 1, wherein the matching rule is composed of rule identifiers and sentence patterns constructing malicious behavior and having the same grammar as a language of the scripts to be

detected, and wherein the relation rule comprises conditional expressions (Cond) in which conditions satisfying the relevant rule are described, and action expressions (Action) in which contents to be executed are described when the conditions in the conditional expressions are satisfied.

3. (Original) The method according to claim 2, wherein the relation rule further includes preconditions (Precond) in which conditions that should be satisfied prior to the conditions in the conditional expressions are described, and the action expressions describe contents that will be executed when both the conditional expressions and the preconditions are satisfied.
